

ESTD. 2001

PRATHYUSA ENGINEERING COLLEGE

DEPARTMENT OF COMPUTER SCIENCE AND ENGINEERING

LAB MANUAL

for

CS3591-COMPUTER NETWORKS LABORATORY

(Regulation 2021, V Semester)

(Odd Semester)

ACADEMIC YEAR: 2023 – 2024

PREPARED BY

THAMBA MESHACH W,

Assistant Professor / CSE

CS3591

COMPUTER NETWORKS LABORATORY

L T P C

3 0 2 4

COURSE OBJECTIVES:

- To understand the concept of layering in networks.
- To know the functions of protocols of each layer of TCP/IP protocol suite.
- To visualize the end-to-end flow of information.
- To learn the functions of network layer and the various routing protocols
- To familiarize the functions and protocols of the Transport layer

LIST OF EXPERIMENTS:

1. Learn to use commands like tcpdump, netstat, ifconfig, nslookup and traceroute. Capture ping and trace route PDUs using a network protocol analyzer and examine.
2. Write a HTTP web client program to download a web page using TCP sockets.
3. Applications using TCP sockets like: a) Echo client and echo server b) Chat
4. Simulation of DNS using UDP sockets.
5. Use a tool like Wireshark to capture packets and examine the packets
6. Write a code simulating ARP /RARP protocols.
7. Study of Network simulator (NS) and Simulation of Congestion Control Algorithms using NS.
8. Study of TCP/UDP performance using Simulation tool.
9. Simulation of Distance Vector/ Link State Routing algorithm.
10. Simulation of an error correction code (like CRC)

TOTAL: 30 PERIODS

COURSE OUTCOMES:

At the end of this course, the students will be able to:

- CO 1:** Explain the basic layers and its functions in computer networks.
- CO 2:** Understand the basics of how data flows from one node to another.
- CO 3:** Analyze routing algorithms.
- CO 4:** Describe protocols for various functions in the network.
- CO 5:** Analyze the working of various application layer protocols.

Ex No : 1 Learn to use commands like `tcpdump`, `netstat`, `ifconfig`, `nslookup` and `traceroute`.

Date: Capture ping and traceroute PDUs using a network protocol analyzer and examine.

AIM: To Learn to use commands like `tcpdump`, `netstat`, `ifconfig`, `nslookup` and `traceroute` ping.

ALGORITHM - Commands:

1. Tcpdump:

❖ **Display traffic between 2 hosts:**

To display all traffic between two hosts (represented by variables `host1` and `host2`):

```
# tcpdump host host1 and host2
```

❖ **Display traffic from a source or destination host only:**

To display traffic from only a source (`src`) or destination (`dst`) host:

```
#tcpdump src host
```

```
#tcpdump dst host
```

❖ **Display traffic for a specific protocol**

Provide the protocol as an argument to display only traffic for a specific protocol,

for example `tcp`, `udp`, `icmp`, `arp`

```
# tcpdump protocol
```

For example to display traffic only for the `tcp` traffic :

```
#tcpdump tcp
```

❖ **Filtering based on source or destination port**

To filter based on a source or destination port:

```
# tcpdump src port ftp
```

```
# tcpdump dst port http
```

2. Netstat

`Netstat` is a common command line TCP/IP networking available in most versions of Windows, Linux, UNIX and other operating systems.

```
#netstat
```

3. Ipconfig

From the command prompt, type **ipconfig** to run the utility with default options. The output of the default command contains the IP address, network mask, and gateway for all physical and virtual network adapter.

```
#ipconfig
```

4. nslookup

The **nslookup** (which stands for *name server lookup*) command is a network utility program used to obtain information about internet servers. It finds name server information for domains by querying the Domain Name System.

```
#nslookup
```

5. Trace route:

With the tracert command shown above, we're asking tracert to show us the path from the local computer all the way to the network device with the hostname `www.google.com`.

```
#tracert google.com
```

6. Ping:

The ping command sends an echo request to a host available on the network. Using this command, you can check if your remote host is responding well or not.

```
# ping172.16.6.2
```

OUTPUT : Commands

1) Tcpdump:

❖ **Display traffic between 2 hosts:**

To display all traffic between two hosts (represented by variables host1 and host2):

```
# tcpdump host host1 and host2
```

❖ **Display traffic from a source or destination host only:**

To display traffic from only a source (src) or destination (dst) host:

```
#tcpdumpsrc host
```

```
#tcpdumpdst host
```

❖ **Display traffic for a specific protocol**

Provide the protocol as an argument to display only traffic for a specific protocol, for example tcp, udp, icmp, arp

```
# tcpdump protocol
```

For example to display traffic only for the tcp traffic :

```
# tcpdumpectcp
```

❖ **Filtering based on source or destination port**

To filter based on a source or destination port:

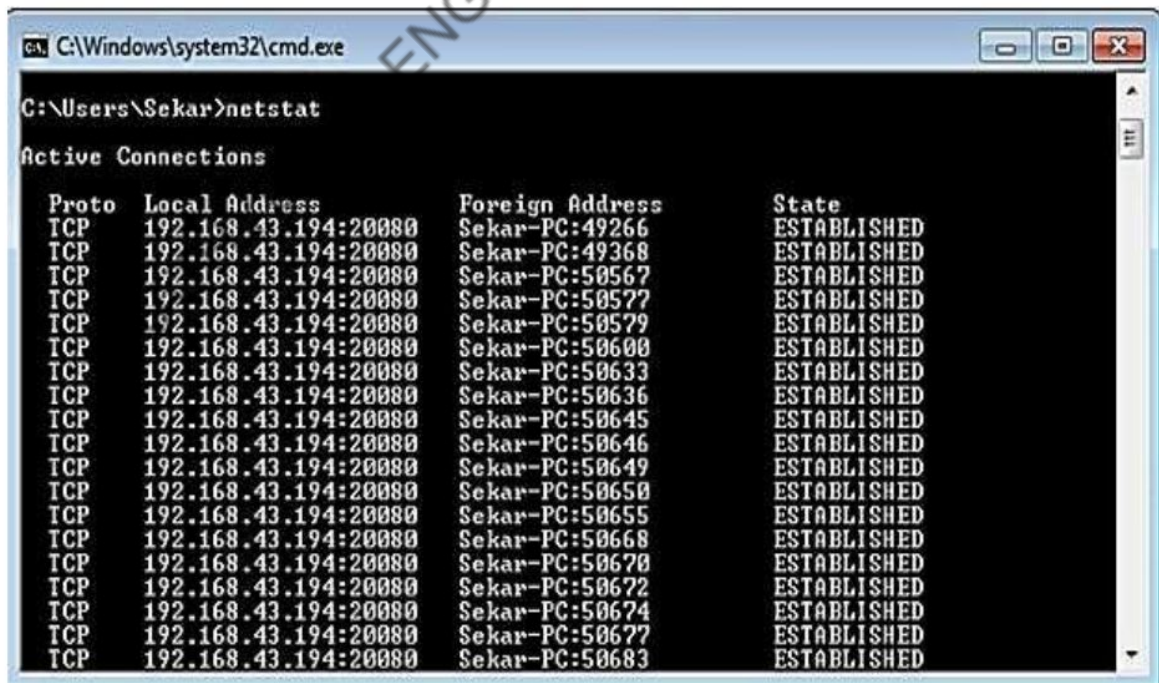

```
# tcpdumpsrc port ftp
```

```
# tcpdumpdst port http
```

2) **Netstat:**

Displays protocol statistics and current TCP/IP network connections.

>netstat

```
C:\Windows\system32\cmd.exe
C:\Users\Sekar>netstat

  8  *        *        *        Request timed out.
  9  77 ns   52 ns   50 ns   naa05a10-in-x0e.1e100.net [2404:6800:4007:808::200e]

Trace complete.

C:\Users>
```

6) **Ping:**

>ping172.16.6.2

A screenshot of a Windows Command Prompt window. The title bar reads "Command Prompt". The command prompt shows the user typing "ping 172.16.6.2". The output indicates that the ping failed, with four "Request timed out." messages. The ping statistics show "Packets: Sent = 4, Received = 0, Lost = 4 (100% loss)". The prompt ends with "C:\Users\User>".

```
C:\Users\User>ping 172.16.6.2

Pinging 172.16.6.2 with 32 bytes of data:
Request timed out.
Request timed out.
Request timed out.
Request timed out.

Ping statistics for 172.16.6.2:
    Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),

C:\Users\User>
```

RESULT:

Thus the various networks commands like tcpdump, netstat, ifconfig, nslookup and traceroute ping are executed successfully.

Ex No: 2 **Write a HTTP web client program to download a web page using TCP sockets**

Date:

AIM:

To write a java program for socket for HTTP for web page upload and download.

ALGORITHM:

Client:

1. Start.
2. Create socket and establish the connection with the server.
3. Read the image to be uploaded from the disk
4. Send the image read to the server
5. Terminate the connection
6. Stop.

Server:

1. Start
2. Create socket, bind IP address and port number with the created socket and make server a listening server.
3. Accept the connection request from the client
4. Receive the image sent by the client.
5. Display the image.
6. Close the connection.
7. Stop.

PROGRAM

Client

```
import javax.swing.*;
import java.net.*;
import java.awt.image.*;
import javax.imageio.*;
import java.io.*;
import java.awt.image.BufferedImage; import
java.io.ByteArrayOutputStream; import
java.io.File;
import java.io.IOException; import
javax.imageio.ImageIO;
public class Client
{
public static void main(String args[]) throws Exception
{
Socket soc;
BufferedImage img = null;
soc=new
Socket("localhost",4000);
System.out.println("Client is running.");
try
{
System.out.println("Reading image from disk. ");
img = ImageIO.read(new File("digital_image_processing.jpg")); ByteArrayOutputStream baos = new
ByteArrayOutputStream();
ImageIO.write(img, "jpg", baos);
baos.flush();
byte[] bytes = baos.toByteArray();
baos.close();
System.out.println("Sending image to server.");
OutputStream out = soc.getOutputStream();
```

```
DataOutputStream dos = new DataOutputStream(out);
dos.writeInt(bytes.length);
dos.write(bytes, 0, bytes.length);
System.out.println("Image sent to server. ");
dos.close();
out.close();
}
catch (Exception e)
{
System.out.println("Exception: " + e.getMessage());
soc.close();
}
soc.close();
}
}
```

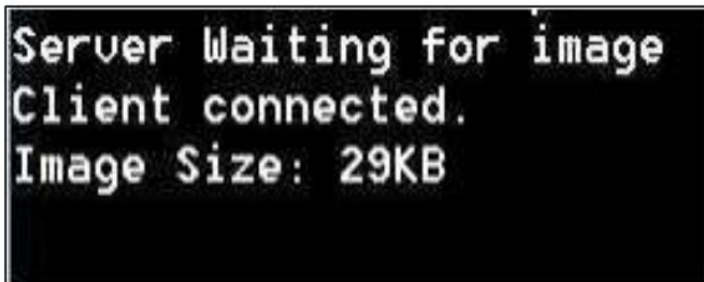

Server

```
import java.net.*;
import java.io.*;
import java.awt.image.*;
import javax.imageio.*;
import javax.swing.*;
class Server
{
    public static void main(String args[]) throws Exception
    {
        ServerSocket server=null;
        Socket socket;
        server=new ServerSocket(4000);
        System.out.println("Server Waiting for image");
        socket=server.accept();
        System.out.println("Client connected.");
        InputStream in = socket.getInputStream();
```

```
DataInputStream dis = new DataInputStream(in);
Int len = dis.readInt();
System.out.println("Image Size: " + len/1024 + "KB");
byte[] data = new byte[len];
dis.readFully(data);
dis.close();
in.close();
InputStream ian = new ByteArrayInputStream(data);
BufferedImage bImage = ImageIO.read(ian);
JFrame f = new JFrame("Server");
ImageIcon icon = new ImageIcon(bImage);
JLabel l = new JLabel();
l.setIcon(icon);
f.add(l);
f.pack();
f.setVisible(true);
}
}
```

OUTPUT:

When you run the client code, following output screen would appear on client side.

```
Server Waiting for image
Client connected.
Image Size: 29KB
```

RESULT:

Thus the socket program for HTTP for web page upload and download was developed and executed successfully.

Ex No: 3 Applications using TCP sockets like: Echo client and echo server, Chat

Date:

AIM

To write a java program for application using TCP Sockets Links

A) Echo client and echo server

ALGORITHM

Client

1. Start
2. Create the TCP socket
3. Establish connection with the server
4. Get the message to be echoed from the user
5. Send the message to the server
6. Receive the message echoed by the server
7. Display the message received from the server
8. Terminate the connection
9. Stop

Server

1. Start
2. Create TCP socket, make it a listening socket
3. Accept the connection request sent by the client for connection establishment
4. Receive the message sent by the client
5. Display the received message
6. Send the received message to the client from which it receives
7. Close the connection when client initiates termination and server becomes a listening server, waiting for clients.
8. Stop.

PROGRAM:**EServer.java**

```
import java.net.*;
import java.io.*;
public class EServer
{
public static void main(String args[])
{
    ServerSocket s=null;
    String line;

AIM:

To use a tool like Wireshark to capture packets and examine the packets

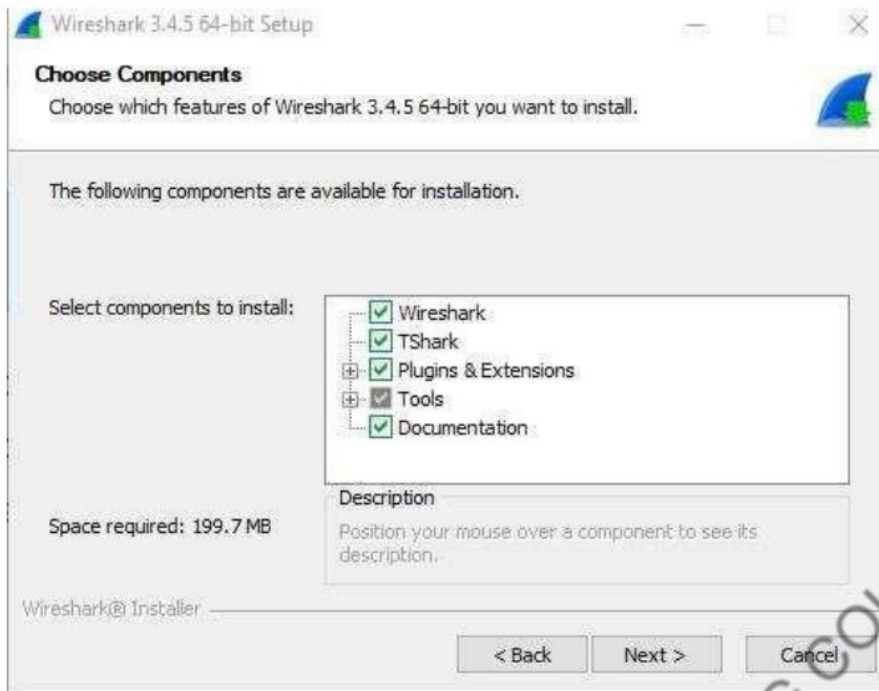

STEPS:

1. Installing Wireshark

- Go to <https://www.wireshark.org/download.html> to visit the Wireshark download page. Ensure that the full URL is used.
The output will look similar to the following:

- Download the Windows Installer (64 bit).
Click on the link for version of software, and see a pop-up box at the foot of the screen. Choose run, and when the UAC prompt appears, choose Yes.
This will bring up the installation wizard.

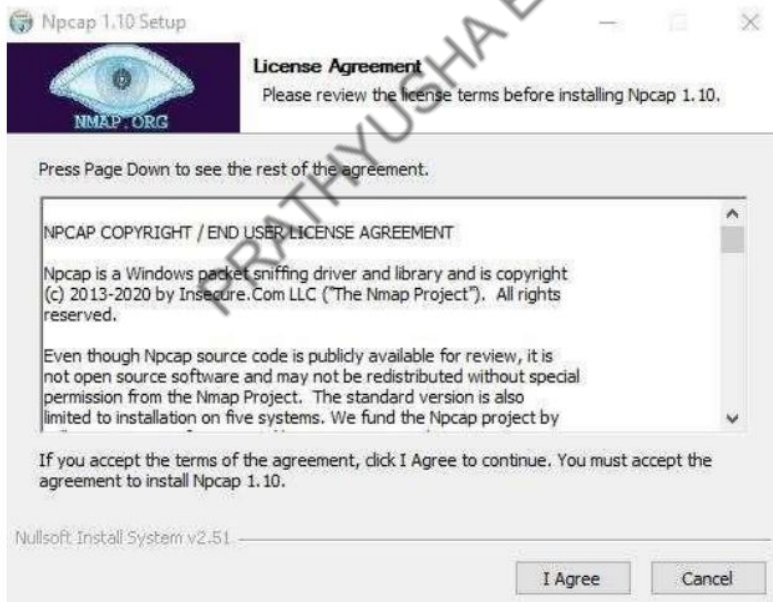

- Keep pressing 'Next' and accept the defaults.

The installation will commence, and the pop-up box below will appear.

Accept the license agreement and press I Agree.

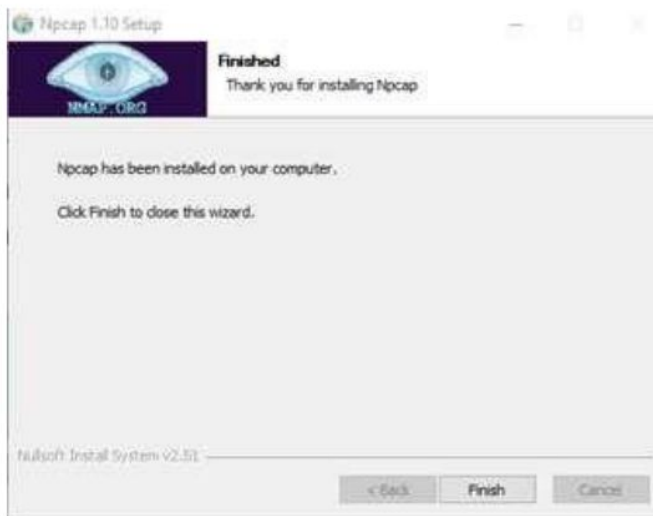

Accept the default settings.

- Accept the default settings by pressing Next.

The following wizard will appear.

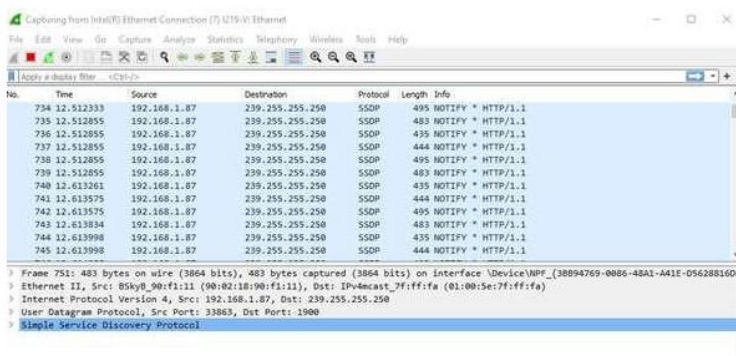

Press Finish.

- The Wireshark installation will still be running in the background. It should take roughly another 2-3 minutes. The wizard will appear to say the installation is complete. Select Next, then Finish. You will now see a Wireshark shortcut on the desktop, the same as below:

- Double-click it and choose your network interface. When your Wireshark console appears, it should look similar to that shown below. If you need to change the interface, go to Capture and select Options.

- The view above shows The Main Window, which is broken into different sections:
 - The Menu: This is broken into the following 11 headings: File, Edit, View, Go, Capture, Analyze, Statistics, Telephony, Wireless, Tools, Help.
 - The Filter Toolbar: This has a filter pane when you type in the protocol that you want to view.
 - The Packet List: This shows all packets that are captured and is shown in blue in the preceding image.
 - The Packet Details Pane: This is the gray area that shows the protocol fields of the packet.
 - The Packet Bytes Pane: This shows a canonical hex dump of the packet data.

```

2. Capturing Packets

- Go to the Capture drop-down menu option.
 - Options lets you change the network interface.
 - Press the shark symbol with the word Start.
 - Once you are finished capturing the traffic, press the red square with the word Stop on it.
 - These menus are context-sensitive; for example, the Stop button does not become live until after the Start button appears.
- Always have web browser ready before pressing ‘Start’.
 - Once start up Wireshark, capture a vast amount of traffic.
 - After capturing it, filter the different types of traffic.

3. Preparation Before Capture

- Go to Google and search for ‘Josh Dobbs Mike Glennon’.
 - The top of the search list should be similar to that shown below.
 - If that article is not available, go to the Amazon website instead and search for the Ian Neil Security+.
 - The following instructions will be the same.

4. Starting the Capture

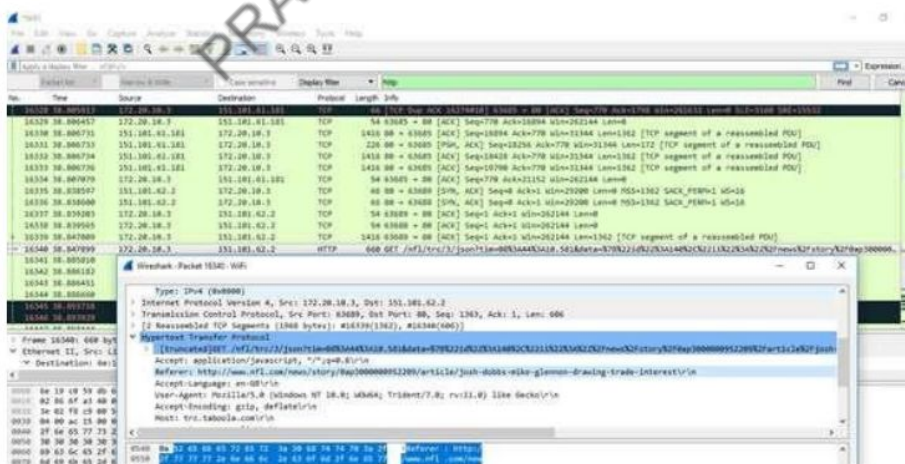

- Start Wireshark, go to Capture, then press Start.
- Go to Google and press the hyperlink for the preceding article.
- Massive number of packets being captured.

5. Stop the Capture

- Go to Wireshark, Capture menu, and Press Stop.
- Captured quite a few packets.
- On this occasion, capture over 20,000 packets in about 3 minutes.

6. Saving the Capture File

- On the Wireshark console, in the top left-hand corner, choose File.
- Then select 'Save as' and save it as a pcap file (a packet capture file).

7. Filtering the Capture File (cap)

- In the captured packet, insert the filter http.

Now only TCP and HTTP traffic can be viewed.

The packet 16340 relates to arrival at the articles on the nfl.com website.

The IP Address is 172.20.10.1, and the destination is 151.101.62.2.

The request to go to a website uses the HTTP verb GET.

Now search the trace for the packet when arrived at this article?

Open the frame in the packet details pane.

It is using IPV4, and the traffic is TCP.

Expand the HTTP packet, and the referrer will show the page that isited.

PRATHYUSHA ENGINEERING COLLEGE

RESULT:

Thus Wireshark tool is used to capture packets and examine the packets

Ex No:6

Write a code simulating ARP /RARP protocols

Date:

A) Program for Address Resolution Protocol (ARP) using TCP

AIM:

To write a java program for simulating ARP protocols using TCP.

ALGORITHM:

Client

1. Start the program
2. Create socket and establish connection with the server.
3. Get the IP address to be converted into MAC address from the user.
4. Send this IP address to server.
5. Receive the MAC address for the IP address from the server.
6. Display the received MAC address
7. Terminate the connection

Server

1. Start the program
2. Create the socket, bind the socket created with IP address and port number and make it a listening socket.
3. Accept the connection request when it is requested by the client.
4. Server maintains the table in which IP and corresponding MAC addresses are stored.
5. Receive the IP address sent by the client.
6. Retrieve the corresponding MAC address for the IP address and send it to the client.
7. Close the connection with the client and now the server becomes a listening server waiting for the connection request from other clients
8. Stop

A) PROGRAM FOR ARP

Clientarp.java:

```
import java.io.*;
import java.net.*;
import java.util.*;
class Clientarp
{
public static void main(String args[])
{
try
{
BufferedReader in=new BufferedReader(new InputStreamReader(System.in));
Socket clsct=new Socket("127.0.0.1",139);
DataInputStream din=new DataInputStream(clsct.getInputStream());
DataOutputStream dout=new DataOutputStream(clsct.getOutputStream()); System.out.println("Enter the
Logical address(IP):");
String str1=in.readLine();
dout.writeBytes(str1+"\n");
String str=din.readLine();
System.out.println("The Physical Address is: "+str);
clsct.close();
}
catch (Exception e)
{
System.out.println(e);
}
}
}
```

Serverarp.java:

```
import java.io.*;
import java.net.*;
import java.util.*;
class Serverarp
{
public static void main(String args[])
{
try
{
ServerSocket obj=new ServerSocket(139);
Socket obj1=obj.accept();
while(true)
{
DataInputStream din=new DataInputStream(obj1.getInputStream());
DataOutputStream dout=new DataOutputStream(obj1.getOutputStream());
String str=din.readLine();
String ip[]={"165.165.80.80","165.165.79.1"};
String mac[]={"6A:08:AA:C2","8A:BC:E3:FA"};
for(inti=0;i<ip.length;i++)
{
if(str.equals(ip[i]))
{
dout.writeBytes(mac[i]+'\\n');
break;
}
}
obj.close();
}
}
```

```
catch(Exception e)
{
System.out.println(e);
}
}
}
```

Output:

E:\networks>java Serverarp

E:\networks>java Clientarp

Enter the Logical address(IP):165.165.80.80

The Physical Address is: 6A:08:AA:C2

PRATHYUSHA ENGINEERING COLLEGE

B) Program for Reverse Address Resolution Protocol (RARP) using TCP

AIM:

To write a java program for simulating RARP protocols using TCP.

ALGORITHM:

Client

1. Start the program
2. Create datagram socket
3. Get the MAC address to be converted into IP address from the user.
4. Send this MAC address to server using UDP datagram.
5. Receive the datagram from the server and display the corresponding IP address.
6. Stop

Server

1. Start the program.
2. Server maintains the table in which IP and corresponding MAC addresses are stored.
3. Create the datagram socket
4. Receive the datagram sent by the client and read the MAC address sent.
5. Retrieve the IP address for the received MAC address from the table.
6. Display the corresponding IP address.
7. Stop

PROGRAM FOR RARP

Clientrarp12.java:

```
import java.io.*;
import java.net.*;
import java.util.*;
class Clientrarp12
{
public static void main(String args[])
{
try
{
DatagramSocket client=new DatagramSocket();

InetAddress addr=InetAddress.getByName("127.0.0.1");

byte[] sendbyte=new byte[1024];

byte[] receivebyte=new byte[1024];

BufferedReader in=new BufferedReader(new InputStreamReader(System.in));

System.out.println("Enter the Physical address (MAC):");

String str=in.readLine();

sendbyte=str.getBytes();

DatagramPacket sender = newDatagramPacket (sendbyte, sendbyte.length, addr, 1309);

client.send(sender);

DatagramPacket receiver=new DatagramPacket(receivebyte,receivebyte.length);

client.receive(receiver);

String s=new String(receiver.getData());

System.out.println("The Logical Address is(IP): "+s.trim());

client.close();

}

catch(Exception e)

{
```

```
System.out.println(e);  
}  
}  
}
```

Serverarp12.java:

```
import java.io.*  
import java.net.*;  
import java.util.*;  
class Serverarp12  
{  
public static void main(String args[])  
{  
Try  
{  
DatagramSocket server=new DatagramSocket(1309);  
while(true)  
{  
byte[] sendbyte=new byte[1024];  
byte[] receivebyte=new byte[1024];  
DatagramPacket receiver=new DatagramPacket( receivebyte,receivebyte. length);  
server.receive(receiver);  
String str=new String(receiver.getData());  
String s=str.trim();  
InetAddress addr=receiver.getAddress();  
int port=receiver.getPort();  
String ip[]{"165.165.80.80","165.165.79.1"};  
String mac[]{"6A:08:AA:C2","8A:BC:E3:FA"};  
for(inti=0;i<ip.length;i++)  
{  
if(s.equals(mac[i]))
```

```
{
sendbyte=ip[i].getBytes();
DatagramPacket sender = new DatagramPacket( sendbyte,sendbyte. length,addr,port);
server.send(sender);
break;
}
}
break;
}
}
}
catch(Exception e)
{
System.out.println(e);
}
}
}
```

Output:

I:\ex>java Serverrarp12

I:\ex>java Clientrarp12

Enter the Physical address (MAC): 6A:08:AA:C2

The Logical Address is(IP): 165.165.80.80

RESULT :

Thus the program for implementing to display simulating ARP and RARP protocols was executed successfully and output is verified.

Ex No: 7 Study of Network simulator (NS) and Simulation of Congestion Control

Date: Algorithms using NS

AIM:

To Study Network simulator (NS).and Simulation of Congestion Control Algorithms using NS

Procedure: NETWORK SIMULATOR (NS2)

Ns Overview

- Ns Status
- Periodical release (ns-2.26, Feb 2003)
- Platform support
- FreeBSD, Linux, Solaris, Windows and Mac

Ns functionalities

- Routing, Transportation,
- Traffic sources,
- Queuing disciplines,
- QoS

Congestion Control Algorithms

- Slow start
- Additive increase/multiplicative decrease
- Fast retransmit and Fast recovery

Case Study: A simple Wireless network.

- Ad hoc routing, mobile IP, sensor-MAC
- Tracing, visualization and various utilities
- NS(Network Simulators)

PROGRAM

B) DISTANCE VECTOR ROUTING ALGORITHM

AIM:

To simulate the Distance vector routing protocols using NS2.

ALGORITHM:

1. Create a simulator object
2. Set routing protocol to Distance Vector routing
3. Trace packets on all links onto NAM trace and text trace file
4. Define finish procedure to close files, flush tracing and run NAM
5. Create eight nodes
6. Specify the link characteristics between nodes
7. Describe their layout topology as a octagon
8. Add UDP agent for node n1
9. Create CBR traffic on top of UDP and set traffic parameters.
10. Add a sink agent to node n4
11. Connect source and the sink
12. Schedule events as follows:
 - a. Start traffic flow at 0.5
 - b. Down the link n3-n4 at 1.0
 - c. Up the link n3-n4 at 2.0
 - d. Stop traffic at 3.0
 - e. Call finish procedure at 5.0
13. Start the scheduler
14. Observe the traffic route when link is up and down
15. View the simulated events and trace file analyze it
16. Stop

OUTPUT

\$ nsdistvect.tcl

The screenshot shows the NS2 terminal window. The system tray at the top right displays 'Thu Sep 27, 10:15 AM' and 'root'. The window title is 'ns2.tcl - shell'. The terminal output shows a series of log entries for 'rtProtoDV' and 'chr 500' processes. The output is as follows:

```

t 0.000000 1 2 rtProtoDV 0 ..... 0 4.1 5.0 1 77
r 0.218651 4 3 rtProtoDV 0 ..... 0 4.1 5.0 1 77
+ 0.27794 1 0 rtProtoDV 0 ..... 0 1.1 0.2 -1 79
- 0.27794 1 0 rtProtoDV 0 ..... 0 1.1 0.2 -1 79
+ 0.27794 1 2 rtProtoDV 0 ..... 0 1.1 2.1 -1 79
- 0.27794 1 2 rtProtoDV 0 ..... 0 1.1 2.1 -1 79
r 0.288004 1 0 rtProtoDV 0 ..... 0 1.1 0.2 -1 79
r 0.288004 1 2 rtProtoDV 0 ..... 0 1.1 2.1 -1 79
+ 0.399578 5 4 rtProtoDV 0 ..... 0 5.1 4.1 -1 80
- 0.399578 5 4 rtProtoDV 0 ..... 0 5.1 4.1 -1 80
+ 0.399578 5 0 rtProtoDV 0 ..... 0 5.1 0.1 -1 81
- 0.399578 5 0 rtProtoDV 0 ..... 0 5.1 0.1 -1 81
+ 0.408238 7 0 rtProtoDV 0 ..... 0 7.1 0.2 -1 82
- 0.408238 7 0 rtProtoDV 0 ..... 0 7.1 0.2 -1 82
+ 0.408238 7 0 rtProtoDV 0 ..... 0 7.1 0.1 -1 83
- 0.408238 7 0 rtProtoDV 0 ..... 0 7.1 0.1 -1 83
r 0.408238 5 0 rtProtoDV 0 ..... 0 5.1 4.1 -1 80
r 0.408238 5 0 rtProtoDV 0 ..... 0 5.1 0.1 -1 81
+ 0.418302 7 0 rtProtoDV 0 ..... 0 7.1 0.2 -1 82
- 0.418302 7 0 rtProtoDV 0 ..... 0 7.1 0.1 -1 83
t 0.5 0 1 chr 500 ..... 0 0 0 3 0 0 84
r 0.5 0 1 chr 500 ..... 0 0 0 3 0 0 84
+ 0.505 0 1 chr 500 ..... 0 0 0 3 0 1 85
- 0.505 0 1 chr 500 ..... 0 0 0 3 0 1 85

```

The terminal window also shows a menu bar with 'File', 'Edit', 'View', 'Search', 'Tools', 'Documents', and 'Help'. Below the menu bar are buttons for 'Open', 'Save', and 'Quit'. The status bar at the bottom indicates 'Plain Text', 'Tab Width: 8', 'Ln 1, Col 1', and 'NS2'.

RESULT:

Thus, the simulation for Distance vector and link state routing protocols was done using NS2.

Ex No:10 Simulation of Error Detection Code (like CRC)

Date:

AIM:

To implement error checking code using java.

ALGORITHM:

1. Start the Program
2. Given a bit string, append 0s to the end of it (the number of 0s is the same as the degree of the generator polynomial) let $B(x)$ be the polynomial corresponding to B.
3. Divide $B(x)$ by some agreed on polynomial $G(x)$ (generator polynomial) and determine the remainder $R(x)$. This division is to be done using Modulo 2 Division.
4. Define $T(x) = B(x) - R(x)$
5. $(T(x)/G(x) \Rightarrow \text{remainder } 0)$
6. Transmit T, the bit string corresponding to $T(x)$.
7. Let T' represent the bit stream the receiver gets and $T'(x)$ the associated polynomial. The receiver divides $T'(x)$ by $G(x)$. If there is a 0 remainder, the receiver concludes $T = T'$ and no error occurred otherwise, the receiver concludes an error occurred and requires a retransmission
8. Stop the Program

PROGRAM

```
import java.io.*;

class crc_gen
{
public static void main(String args[]) throws IOException
{
BufferedReader br=new BufferedReader(new InputStreamReader(System.in));

int[] data;
int[] div;
int[] divisor;
int[] rem;
int[] crc;

int data_bits, divisor_bits, tot_length;

System.out.println("Enter number of data bits : ");
data_bits=Integer.parseInt(br.readLine());

data=new int[data_bits];

System.out.println("Enter data bits : ");
for(inti=0; i<data_bits; i++) data[i]=Integer.parseInt(br.readLine());

System.out.println("Enter number of bits in divisor : ");
divisor_bits=Integer.parseInt(br.readLine());

divisor=new int[divisor_bits];

System.out.println("Enter Divisor bits : ");

for(inti=0; i<divisor_bits; i++)
divisor[i]=Integer.parseInt(br.readLine());

System.out.print("Data bits are : ");
for(inti=0; i<data_bits; i++)

System.out.print(data[i]);

System.out.println();

System.out.println("divisor bits are : ");
for(inti=0; i<divisor_bits; i++)

System.out.print(divisor[i]);
```

```

System.out.println();

*/
tot_length=data_bits+divisor_bits-1;

div=new int[tot_length];
rem=new int[tot_length];

crc=new int[tot_length];

/*----- CRC GENERATION-----*/

for(inti=0;i<data.length;i++)
div[i]=data[i];

System.out.print("Dividend (after appending 0's) are : ");
for(inti=0; i<div.length; i++)
System.out.print(div[i]);

System.out.println();
for(int j=0; j<div.length; j++)
{
rem[j] = div[j];
}

rem=divide(div, divisor, rem);
for(inti=0;i<div.length;i++)
{
//append dividend and remainder
crc[i]=(div[i]^rem[i]);
}

System.out.println();
System.out.println("CRC code : ");

for(inti=0;i<crc.length;i++)
System.out.print(crc[i]);

```

```
/*-----.ERROR DETECTION-----*/
```

```
System.out.println();
```

```
System.out.println("Enter CRC code of "+tot_length+" bits : ");
```

```
for(int i=0; i<crc.length; i++) crc[i]=Integer.parseInt(br.readLine());
```

```
System.out.print("crc bits are : ");
```

```
for(int i=0; i<crc.length; i++)
```

```
System.out.print(crc[i]);
```

```
System.out.println();
```

```
for(int j=0; j<crc.length; j++){
```

```
rem[j] = crc[j];
```

```
}
```

```
rem=divide(crc, divisor, rem);
```

```
for(int i=0; i<rem.length; i++)
```

```
{
```

```
if(rem[i]!=0)
```

```
System.out.println("Error");
```

```
break;
```

```
}
```

```
if(i==rem.length-1)
```

```
System.out.println("No Error");
```

```
}
```

```
System.out.println("THANK YOU.....");
```

```
}
```

```
static int[] divide(int div[],int divisor[], int rem[])
```

```
{
```

```
int cur=0;
while(true)
{
for(int i=0;i<divisor.length;i++)

rem[cur+i]=(rem[cur+i]^divisor[i]);
while(rem[cur]==0 && cur!=rem.length-1)

cur++;
if((rem.length-cur)<divisor.length)

break;
}

return rem;
}
}
```

OUTPUT

Enter number of data bits :
