PRATHYUSHA ENGINEERING COLLEGE
DEPARTMENT OF COMPUTER SCIENCE AND ENGINEERING

LAB MANUAL
for
CS3461-OPERATING SYSTEMS LABORATORY
(Regulation 2021, IV Semester)
(Even Semester)

ACADEMIC YEAR: 2023 – 2024

PREPARED BY
N.SRIPRIYA,
Assistant Professor / CSE

PRATHYUSHA ENGINEERING COLLEGE

Department of Computer Science and Engineering

Vision of the Department

To Excel in the emerging areas of Computer Science and Engineering by imparting knowledge, relevant practices and inculcating human values to transform the students as potential resources to contribute innovatively through advanced computing in real time situations.

Mission of the Department

- DM1.** To provide strong fundamentals and technical skills for Computer Science applications through effective teaching learning methodologies.
- DM2.** To transform lives of the students by nurturing ethical values, creativity and novelty to become Entrepreneurs and establish start-ups.
- DM3.** To habituate the students to focus on sustainable solutions to improve the quality of life and the welfare of the society.
- DM4.** To enhance the fabric of research in computing through collaborative linkages with industry and academia.
- DM5.** To inculcate learning of the emerging technologies to pursue higher studies leading to lifelong learning.

CS8461 OPERATING SYSTEMS LABORATORY

COURSE OBJECTIVES AND OUTCOMES

OBJECTIVES:

- To learn Unix Commands and shell programming.
- To implement various CPU Scheduling Algorithms.
- To implement process creation and Inter Process Communication.
- To implement Deadlock Avoidance and Deadlock Detection Algorithms.
- To implement Page Replacement Algorithms.
- To implement File Organization and File Allocation Strategies.

List of Experiments:

1. Basics of UNIX commands.
2. Write programs using the following system calls of UNIX operating system fork, exec, getpid, exit, wait, close, stat, opendir, readdir.
3. Write C programs to simulate UNIX commands like cp, ls, grep, etc.
4. Shell Programming.
5. Write C Programs to implement various CPU Scheduling algorithms.
6. Implementation of Semaphores
7. Implementation of Shared memory and IPC
8. Bankers Algorithm for Dead Lock Avoidance
9. Implementation of Dead Lock Detection Algorithm
10. Write a C program to implement Threading & Synchronization Applications
11. Implementation of the following Memory Allocation Methods for fixed partition
 - a) First Fit b) Worst Fit c) Best Fit
12. Implementation of Paging Technique of memory management
13. Implementation of the following Page Replacement Algorithms
 - a) FIFO b) LRU c) LFU
14. Implementation of the various File Organization Techniques
15. Implementation of the following File Allocation Strategies
 - a) Sequential b) Indexed c) Linked

OUTCOMES:

At the end of the course, the student should be able to

- Compare the performance of various CPU Scheduling Algorithms
- Implement Deadlock avoidance and Detection Algorithms
- Implement Semaphores
- Create processes and implement IPC
- Analyze the performance of the various Page Replacement Algorithms
- Implement File Organization and File Allocation Strategies

System Requirements

Standalone desktops server with C / C++ / Java / Equivalent complier 30 Nos.

Ex. No: 1

BASICS OF UNIX COMMANDS

AIM:

To study and execute the commands in Unix.

COMMANDS:

1. Date Command:

This command is used to display the current date and time.

Syntax :

\$date

\$date +%ch

Options :-

a = Abbreviated weekday.

A = Full weekday.

b = Abbreviated month.

B = Full month.

c = Current day and time.

C = Display the century as a decimal number.

d = Day of the month.

D = Day in „mm/dd/yy“ format

h = Abbreviated month day.

H = Display the hour.

L = Day of the year.

m = Month of the year.

M = Minute.

P = Display AM or PM

S = Seconds

T = HH:MM:SS format

u = Week of the year.

y = Display the year in 2 digit.

Y = Display the full year.

Z = Time zone .

To change the format:

Syntax:

\$date “+%H-%M-%S”

2. Calendar Command:

This command is used to display the calendar of the year or the particular month of calendar year.

Syntax:

a. \$cal <year>

b. \$cal <month><year>

Here the first syntax gives the entire calendar for given year & the second Syntax gives the calendar of reserved month of that year.

3. Echo Command:

This command is used to print the arguments on the screen.

Syntax: \$echo <text>

Multi line echo command:

To have the output in the same line, the following commands can be used.

Syntax: \$echo <text>\>text

To have the output in different line, the following command can be used.

Syntax: \$echo “text

>line2

>line3”

4.'who' Command:

It is used to display who are the users connected to our computer currently.

Syntax: \$who –option’s

Options: -

H–Display the output with headers.

b–Display the last booting date or time or when the system was lastely rebooted.

5.'who am i' Command:

Display the details of the current working directory.

Syntax: \$who am i

6.'tty' Command:

It will display the terminal name.

Syntax: \$tty

7.'Binary' Calculator Command:

It will change the „\$“ mode and in the new mode, arithmetic operations such as +,- ,*,/,%,n,sqrt(),length(),=, etc can be performed . This command is used to go to the binary calculus mode.

Syntax:

\$bc operations

^d

\$

1 base –inputbase

0 base – outputbase are used for base conversions.

Base:

Decimal = 1 Binary = 2 Octal = 8 Hexa = 16

8.'CLEAR' Command:

It is used to clear the screen.

Syntax: \$clear

9.'MAN' Command:

It helps us to know about the particular command and its options & working. It is like “help” command in windows.

Syntax: \$man <command name>

10. MANIPULATION Command:

It is used to manipulate the screen.

Syntax: \$tput <argument>

Arguments:

1. Clear – to clear the screen.

2. Longname – Display the complete name of the terminal.

3. SSMO – background become white and foreground become black color.

4. rmso – background become black and foreground becomes white color.

11. LIST Command:

It is used to list all the contents in the current working directory.

Syntax: \$ ls –options <arguments>

If the command does not contain any argument means it is working in the Current directory.

Options:

- a– used to list all the files including the hidden files.
- c– List all the files column wise.
- d- List all the directories.
- m-List the files separated by commas.
- p- List files include “/” to all the directories.
- r- List the files in reverse alphabetical order.
- f- List the files based on the list modification date.
- x-List in column wise sorted order.

DIRECTORY RELATED COMMANDS:

1. Present Working Directory Command :

To print the complete path of the current working directory. Syntax: \$pwd

2. MKDIR Command :

To create or make a new directory in a current directory. Syntax: \$mkdir <directory name>

3. CD Command :

To change or move the directory to the mentioned directory. Syntax: \$cd <directory name>

4. RMDIR Command :

To remove a directory in the current directory & not the current directory itself.

Syntax: \$rmdir <directory name>

FILE RELATED COMMANDS:

1. CREATE A FILE:

To create a new file in the current directory we use CAT command.

Syntax:

\$cat > filename

The > symbol is redirectory we use cat command.

2. DISPLAY A FILE:

To display the content of file mentioned we use CAT command without “>” operator.

Syntax:

\$cat filename

3. COPYING CONTENTS:

To copy the content of one file with another. If file doesnot exist, a new file is created and if the file exists with some data then it is overwritten.

Syntax:

\$ cat <filename source>>><destination filename>

\$ cat <source filename>>><destination filename> it is avoid overwriting.

Options: -

-n content of file with numbers included with blank lines.

Syntax:

\$cat -n <filename>

4. SORTING A FILE:

To sort the contents in alphabetical order in reverse order.

Syntax:

\$sort <filename>

5. COPYING CONTENTS FROM ONE FILE TO ANOTHER:

To copy the contents from source to destination file. So that both contents are same.

Syntax:

\$cp <source filename><destination

filename>6. MOVE Command:

To completely move the contents from source file to destination file and to remove the source file.

Syntax:

\$ mv <source filename><destination

filename>7. REMOVE Command:

To permanently remove the file we use this command.

Syntax:

\$rm <filename>

8. WORD Command:

To list the content count of no of lines, words, characters.

Syntax:

\$wc <filename>

Options:

-c – to display no of characters.

-l – to display only the lines.

-w – to display the no of words.

9. LINE PRINTER:

To print the line through the printer, we use lp command.

Syntax:

\$lp <filename>

10. PAGE Command:

This command is used to display the contents of the file page wise & next page can be viewed by pressing the enter key.

Syntax:

\$pg <filename>

11. FILTERS AND PIPES

HEAD: It is used to display the top ten lines of file.

Syntax: \$head<filename>

TAIL: This command is used to display the last ten lines of file.

Syntax: \$tail<filename>

PAGE: This command shows the page by page a screen full of information is displayed after which the pagecommand displays a prompt and passes for the user to strike the enter key to continue scrolling.

Syntax: \$ls -a\p

MORE: It also displays the file page by page .To continue scrolling with more command, press the space barkey.

Syntax: \$more<filename>

GREP: This command is used to search and print the specified patterns from the file.

Syntax: \$grep [option] pattern <filename>

SORT: This command is used to sort the data in some order.

Syntax: \$sort<filename>

PIPE: It is a mechanism by which the output of one command can be channeled into the input of anothercommand.

Syntax: \$who | wc -l

TR: The tr filter is used to translate one set of characters from the standard inputs to another.

Syntax: \$tr “[a-z]” “[A-Z]”

COMMUNICATION THROUGH UNIX

COMMANDS 1. MESG

Description: The message command is used to give permission to other users to send message to your terminal.

Syntax: \$mesg y

2. Command: WRITE

Description: This command is used to communicate with other users, who are logged in at the same time.

Syntax: \$write <user name>

3. Command: WALL

Description: This command sends message to all users those who are logged in using the unix server.

Syntax: \$wall <message>

4. Command: MAIL

Description: It refers to textual information, which can be transferred from one user to another

Syntax: \$mail <user name>

5. Command: REPLY

Description: It is used to send reply to specified user.

Syntax: \$reply<user name>

INFERENCE:

RESULT:

Thus the program to study and execute Unix commands is done successfully.

Ex. No: 2	SYSTEM CALLS OF UNIX OS
------------------	--------------------------------

AIM:

To write the program to create a Child Process using system call.

ALGORITHM :

- Step 1 : Declare the variable pid.
- Step 2 : Get the pid value using system call fork().
- Step 3 : If pid value is less than zero then print as “Fork failed”.
- Step 4 : Else if pid value is equal to zero include the new process in the system’s file using execlp system call.
- Step 5 : Else if pid is greater than zero then it is the parent process and it waits till the child completes using the system call wait()
- Step 6 : Then print “Child complete”.

SYSTEM CALLS USED:

1. fork() Used to create new processes. The new process consists of a copy of the address space of the original process. The value of process id for the child process is zero, whereas the value of process id for the parent is an integer value greater than zero. **Syntax :** fork()
2. execlp() Used after the fork() system call by one of the two processes to replace the process’ memory space with a new program. It loads a binary file into memory destroying the memory image of the program containing the execlp system call and starts its execution. The child process overlays its address space with the UNIX command /bin/ls using the execlp system call. **Syntax :** execlp()
3. wait() The parent waits for the child process to complete using the wait system call. The wait system call returns the process identifier of a terminated child, so that the parent can tell which of its possibly many children has terminated. **Syntax :** wait(NULL)
4. exit() A process terminates when it finishes executing its final statement and asks the operating system to delete it by using the exit system call. At that point, the process may return data (output) to its parent process (via the wait system call). **Syntax:** exit(0)
5. getpid() Each process is identified by its id value. This function is used to get the id value of a particular process.
6. getppid() Used to get particular process parent’s id value. perror()
7. perror() Indicate the process error.
8. opendir() Open a directory.
9. readdir() Read a directory.

10. closedir() Close a directory.
11. execlp() Used after the fork() system call by one of the two processes to replace the process“memory space with a new program. It loads a binary file into memory destroying the memory image of the program containing the execlp system call and starts its execution. The child process overlays its address space with the UNIX command /bin/ls using the execlp system call.
Syntax : execlp()
12. fork () Used to create new process. The new process consists of a copy of the address space of the original process. The value of process id for the child process is zero, whereas the value of process id for the parent is an integer value greater than zero.
Syntax: fork ()
13. wait () The parent waits for the child process to complete using the wait system call. The wait system call returns the process identifier of a terminated child, so that the parent can tell which of its possibly many children has terminated. **Syntax:** wait (NULL)
14. exit () A process terminates when it finishes executing its final statement and asks the operating system to delete it by using the exit system call. At that point, the process may return data (output) to its parent process (via the wait system call). **Syntax:** exit(0)

PROGRAM:

1)FORK SYSTEM CALL PROGRAM:

```
#include<stdio.h>
#include<stdlib.h>
int main()
{
    int pid;
    pid=fork();
    printf("\n THIS LINE EXECUTED TWICE");
    if(pid== -1)
    {
        printf("\n CHILD PROCESS NOT CREATED\n");
        exit(0);
    }
    if(pid==0)
    {
        printf("\n I AM CHILD PROCESS AND MY ID IS %d \n",getpid());
        printf("\n THE CHILD PARENT PROCESS ID IS:%d \n",getppid());
    }
    else
    {
        printf("\n I AM PARENT PROCESS AND MY ID IS:%d\n",getpid());
        printf("\n THE PARENTS PARENT PROCESS ID IS:%d\n",getppid());
    }
    printf("\n IT CAN BE EXECUTED TWICE");
    printf("\n");
}
```

OUTPUT:

2)SYSTEM CALL WITH ARGUMENT PROGRAM:

```
#include<stdio.h>
#include<stdlib.h>
int main(int argc,int *argv[])
{
    int pid,i;
    pid=fork();
    printf("\n THIS LINE EXECUTED TWICE");
    if(pid== -1)
        {
            printf("\n CHILD PROCESS NOT CREATED\n");
            exit(0);
        }
    if(pid== 0)
        {
            printf("\n CHILD PROCESS IS IN PROGRESS\n");
            for(i=0;i<5;i++)
                printf("\n THE CHILD PROCESSING VALUE IS:%d \n",i);
            execvp("ls",argv);
        }
    else
        {
            printf("\n PARENT PROCESS IS IN WAITING\n");
            printf("\n CHILD PROCESS COMPLETED ITS TASK\n");
        }
    exit(0);
}
```

OUTPUT:

3)WORKING WITH DIRECTORY PROGRAM:

```
#include<stdio.h>
#include<sys/types.h>
#include<sys/dir.h>
void main(int argc,char *argv[])
{
    DIR *dir;
    struct dirent *rddir;
    printf("LISTING THE DIRECTORY CONTENT\n");
    dir=opendir(argv[1]);
    printf("THE CURRENT DIRECTORY FILES ARE:\n");
    while((rddir=readdir(dir))!=NULL)
    {
        printf("%s\n",rddir->d_name);
    }
    closedir(dir);
}
```

OUTPUT:

PRATHYUSHA ENGINEERING COLLEGE

4)STAT SYSTEM CALL PROGRAM:

```
#include<stdio.h>
#include<sys/stat.h>
int main( )
{
    struct stat sfile;
```

```
stat("stat.c",&sfile);
printf("file st_uid:%d\n",sfile.st_uid);
printf("file st_gid:%d\n",sfile.st_gid);
printf("file st_size:%ld\n",sfile.st_size);
printf("file st_blocks:%ld\n",sfile.st_blocks);
printf("file serialno:%ld\n",sfile.st_ino);
printf("file recent access time :%ld\n",sfile.st_atime);
printf("file permission change time:%ld\n",sfile.st_ctime);
printf("file recent modified time:%ld\n",sfile.st_mtime);
}
```

OUTPUT:

PRATHYUSHA ENGINEERING COLLEGE

INFERENCE:

RESULT:

Thus the program for system call using Unix as been executed and output is verified successfully.

Ex. No: 3	SIMULATE UNIX COMMAND IN OS

AIM:

To write C Program to Simulate the **ls** Command in UNIX Operating system.

ALGORITHM :

Step 1: Start the process

Step 2: create a directory entry using dirent structure.

Step 3: To define a pointer to a structure, dp predefined structure DIR and another pointer to a structure called ep

Step 4: The directory is opened using the opendir() function

Step 5: In the while loop read each entry using the readdir() function which returns a pointer

Step 6: If no pointer is returned the program is exited, else it will list the files inside the directory.

Step 7: The closedir() function closes this open directory.

Step 8: Stop the process.

PROGRAM CODING:

```
#include<stdio.h>
#include<string.h>
int main(int argc, char *argv[])
{
    FILE *fp1, *fp2;
    char ln[80];
    fp1=fopen(argv[1],"r");
    fp2=fopen(argv[2],"w");
    while(fgets(ln,80,fp1))
    {
        fputs(ln,fp2);
    }
    printf("FILE HAS BEEN COPIED SUCCESSFULLY\n");
    fclose(fp1);
    fclose(fp2);
}
```

OUTPUT:

3b) GREP COMMAND

AIM:

To write C Program to Simulate the grep Command in UNIX Operating system

ALGORITHM:

Step 1: Include necessary header files.

Step 2: Make necessary declarations.

Step 3: Read the file name from the user and open the file in the read only mode.

Step 4: Read the pattern from the user.

Step 5: Read a line of string from the file and search the pattern in that line.

Step 6: If pattern is available, print the line.

Step 7: Repeat the step 4 to 6 till the end of the file.

PROGRAM:

```
#include<stdio.h>
#include<string.h>
#include<stdlib.h>
int strmat(char ln[],char pa[])
{
    int i,j,k;
    for(i=0;ln[i]!='\0';i++)
    {
        for(j=i,k=0;ln[j]==pa[k]&&pa[k]!='\0';j++,k++);
        if(k>0&&pa[k]=='\0')
            return(1);
    }
    return 0;
}
int main(int argc,char *argv[])
{
    FILE *fp1;
```

```
char ln[80];
if(argc<3)
{
    printf("USAGE: FILE_NAME SOURCE_FILE SEARCH PATTERN\n");
}
else
{
    fp1=fopen(argv[2],"r");
    if(fp1=='\0')
    {
        printf("\n SOURCE FILE CANNOT BE OPENED\n");
        exit(0);
    }

}
while(fgets(ln,80,fp1))
{
    if(strmat(ln,argv[1]))
        printf("%s",ln);
}
fclose(fp1);
}
```

OUTPUT:

INFERENCE:

RESULT:

The program for simulation of UNIX commands has been executed and output is verified successfully.

Ex. No: 4	SHELL PROGRAMMING
------------------	--------------------------

AIM:

To write and execute basic shell programs.

PROCEDURE:

1. GREATEST AMONG THREE NUMBERS

ALGORITHM:

Step 1. Read 3 numbers n1,n2 and n3

Step 2. Check if n1 is greater than n2

check n1 is greater than n3 also

announce n1 as greatest

announce n3 as greatest

else, check whether n2 is greater than n3

if yes, announce n2 as greatest

else announce n3 as greatest

PROGRAM:

```
echo "ENTER THREE NUMBERS"
read a b c
if [ $a -gt $b ] && [ $a -gt $c ]
then
echo "$a is greater"
elif [ $b -gt $c ]
then
echo "$b is greater"
else
echo "$c is greater"
fi
```

OUTPUT:

2.FACTORIAL OF A GIVEN NUMBER

ALGORITHM:

Step 1: Read n

Step 2: Initialize fact to 1 and i to n

Step 3: Repeat the following until i>0

Assign fact * i to fact

Decrement i by 1

PROGRAM:

```
echo "ENTER THE NUMBER:"
read n
```

```
fact=1
while [ $n -gt 1 ]
do
fact=`expr $fact \* $n | bc`
n=`expr $n - 1`
done
echo "FACTORIAL OF THE GIVEN NUMBER IS $fact"
```

OUTPUT:

3.SUM OF ODD NUMBERS UPTO N

ALGORITHM:

Step 1: Read n
Step 2: Initialize x=1 and sum=0
Step 3: Repeat the following until x < n Assign sum + x to sum Increment x by2

PROGRAM:

```
echo "enter the range"
read n
x=1
sum=0
while [ $x -le $n ]
do
sum=`expr $sum + $x`
x=`expr $x + 2`
done
echo "sum=$sum"
```

OUTPUT:

4.GENERATION OF FIBONACCI NUMBERS

ALGORITHM:

Step 1: Read n
Step 2: Initialize p=-1, q=1 and I=1
Step 3: Repeat the following until I < n
Assign p + q to r
Assign q to p

Assign r to q
Increment I by 1

PROGRAM:

```
echo "ENTER THE LIMIT:"
read n
p=-1
```

```
q=1
i=1
while [ $i -le $n ]
do
r=`expr $p + $q`
p=$q
q=$r
echo "$r"
i=`expr $i + 1`
done
```

OUTPUT:

5.IMPLEMENT THE ARITHMETIC CALCULATOR

ALGORITHM:

Step 1: Read a, b and option

Step 2: According to the option perform the operation

PROGRAM:

```
echo "ENTER THE VALUE OF A:"
read a
echo "ENTER THE VALUE OF B:"
read b
c=0
echo "ENTER THE OPTION TO PERFORM 1.ADDITION 2.SUBTRACTION 3.MULTIPLICATION
4.DIVISION"
read op
case "$op" in
1)c=`expr $a + $b`;;
2)c=`expr $a - $b`;;
3)c=`expr $a \* $b`;;
4)c=`expr $a / $b`;;
esac
exit
```

OUTPUT:

6.WRITE A SHELL PROGRAM TO FIND THE LARGEST DIGIT OF A NUMBER

ALGORITHM:

Step 1: Get a number from the user
Step 2: Obtain individual digit for the above number using modulo operator
Step 3: Initialize variable max with first digit
Step 4: Compare the value of max with the other digits, if the value of max is lesser update the value of max
Step 5: Display the value of max

PROGRAM:

```
echo "ENTER THE NUMBER"
read a
max=0
while [ $a -gt 0 ]
do
r=`expr $a % 10`
if [ $r -gt $max ]
then
max=$r
fi
a=`expr $a / 10`
done
echo "THE LARGEST DIGIT OF THE NUMBER:$max"
```

OUTPUT:

7. CHECK WHETHER GIVEN STRING IS A PALINDROME OR NOT.

ALGORITHM:

Step 1: Read a String
Step 2: Find the length of the string
Step 3: Start reading from the last character to the first character and store it as a new string in temp
Step 4: Compare both the strings, if it is same the given string is palindrome

PROGRAM:

```
echo "ENTER THE STRING TO CHECK PALINDROME"
read str
len=`echo $str | wc -c`
len=`expr $len-1 | bc`
i=1
j=`expr $len/2 | bc`
while [ $i -le $j ]
```

```
do
k=`echo $str | cut -c $i`
l=`echo $str | cut -c $len`
if [ $k != $l ]
then
echo "$str is not a palindrome"
exit
fi
i=`expr $i+1 | bc`
len=`expr $len-1 | bc`
done
echo "$str is a palindrome"
```

OUTPUT:

8.WRITE A SHELL PROGRAM TO FIND OUT THE REVERSE OF A GIVEN NUMBER

ALGORITHM:

Step 1: Get a number from the user
Step 2: Set a loop upto the number is not equal to zero
Step 3: remainder=number%10
Step 4:rnum=rnum*10+remainder
Step 5: number=number/10
Step 6: if number==rnum print both are same

PROGRAM:

```
echo "ENTER THE NUMBER"
read n
rnum=0
while [ $n -ne 0 ]
do
remainder=`expr $n % 10 | bc`
rnum=`expr $rnum \* 10 + $remainder | bc`
n=`expr $n / 10 | bc`
done
echo "REVERSE OF THE NUMBER IS $rnum"
```

OUTPUT:

INFERENCE:

PRATHYUSHA ENGINEERING COLLEGE

RESULT:

Thus the program to perform shell programming is executed and verified successfully.

Ex. No: 5	IMPLEMENTATION OF CPU SCHEDULING ALGORITHM

AIM:

To implement Scheduling algorithms using C are

- a. FCFS Scheduling Algorithm
- b. SJF Scheduling Algorithm
- c. Priority Scheduling Algorithm
- d. Round Robin Scheduling Algorithm

5.a.FCFSAlgorithm:**AIM:**

To implement FCFS Scheduling algorithm using C.

ALGORITHM:

Step 1: Start the process

Step 2: Accept the number of processes in the ready Queue

Step 3: For each process in the ready Q, assign the process name and the burst time

Step 4: Set the waiting of the first process as $_0$ and its burst time as its turnaround time

Step 5: for each process in the Ready Q calculate

- a) Waiting time $s(n)=$ waiting time $(n-1)$ + Burst time $(n-1)$
- b) Turnaround time $(n)=$ waiting time $(n)+$ Burst time (n)

Step 6: Calculate

- (a) Average waiting time = Total waiting Time / Number of process
- (b) Average Turnaround time = Total Turnaround Time / Number of process

Step 7: Stop the process

PROGRAM:

```
#include<stdio.h>
#include<stdlib.h>
void main ()
{
int n,pid[10],at[10],bt[10],ft[10],wt[10],ta[10],i,j,t,stt=0,totta=0,totwt=0;

OUTPUT:

5. b Shortest Job First(NON-PRE-EMPTIVE SCHEDULING)

AIM:

To implement SJF Scheduling algorithm in C.

ALGORITHM:

Step 1: Start the process

Step 2: Accept the number of processes in the ready Queue

Step 3: For each process in the ready Q, assign the process id and accept the CPU burst time

Step 4: Start the Ready Q according the shortest Burst time by sorting according to lowest to highest burst time.

Step 5: Set the waiting time of the first process as $_0$ and its turnaround time as its burst time.

Step 6: Sort the processes names based on their Burt time Step 7 :For each process in the ready queue, calculate

a) Waiting times(n)= waiting time (n-1) + Burst time (n-1)

b) Turnaround time (n)= waiting time(n)+Burst time(n)

Step 8: Calculate

(a) Average waiting time = Total waiting Time / Number of process

(b) Average Turnaround time = Total Turnaround Time / Number of process

Step 9: Stop the process

PROGRAM:

```
#include<stdio.h>
void main( )
{
    int i,j,t,n,stt=0,pid[10],at[10],bt[10],ft[10],att,wt[10],ta[10],totwt=0,totta=0;
    float avgwt,avgta;
    printf("ENTER THE NUMBER OF PROCESSES:");
    scanf("%d",&n);
    printf("\nENTER THE ARRIVAL TIME:");
    scanf("%d",&att);

for(i=1;i<=n;i++)
{
    pid[i]=i;
    at[i]=att;
    printf("\nEnter THE BURST TIME:");
    scanf("%d",&bt[i]);
}

5.c Priority Scheduling

AIM:

To write a c program to simulate the CPU Scheduling priority algorithm.

ALGORITHM:

Step 1: Start the process

Step 2: Accept the number of processes in the ready Queue

Step 3: For each process in the ready Q, assign the process id and accept the CPU burst time

Step 4: Sort the ready queue according to the priority number.

Step 5: Set the waiting of the first process as $_0$ and its burst time as its turnaround time

Step 6: Arrange the processes based on process priority

Step 7: For each process in the Ready Q calculate

Step 8: for each process in the Ready Q calculate

- a) Waiting times(n)= waiting time (n-1) + Burst time (n-1)
- b) Turnaround time (n)=
waiting time(n)+Burst time(n)

Step 9: Calculate

(a) Average waiting time = Total waiting Time / Number of process

(b) Average Turnaround time = Total Turnaround Time / Number of process Print the results in an order.

Step 10: Stop the process

PROGRAM:

```
#include<stdio.h>
void main( )
{
    int i,j,t,n,stt=0,pid[10],pr[10],at[10],bt[10],ft[10],att;

5.d. Round Robin Scheduling

AIM:

To implement Round Robin Scheduling Algorithm in C

ALGORITHM:

Step 1: Start the process

Step 2: Accept the number of processes in the ready Queue and time quantum (or) time slice

Step 3: For each process in the ready Q, assign the process id and accept the CPU burst time

Step 4: Calculate the no. of time slices for each process where No. of time slice for process (n) = burst time process(n)/time slice

Step 5: If the burst time is less than the time slice then the no. of time slices =1. Step 6: Consider the ready queue is a circular Q, calculate

(a) Waiting time for process(n) = waiting time of process(n-1)+ burst time of process(n-1) + the time difference in getting the CPU from process(n-1)

(b) Turnaround time for process(n) = waiting time of process(n) + burst time of process(n)+ the time difference in getting CPU from process(n)

Step 7: Calculate(a) Average waiting time = Total waiting Time / Number of process

(b) Average Turnaround time = Total Turnaround Time / Number of process

Step 8: Stop the process

PROGRAM:

```
#include<stdio.h>

Ex. No: 6	IMPLEMENTATION OF SEMAPHORES
------------------	-------------------------------------

AIM:

To implement the Producer and Consumer Problem using semaphores

ALGORITHM:

Step 1: Start

Step 2: Initialize the semaphore variable S

Step 3: In the producer function ,

 While s ==1 do nothing

 Produce the value

 Assign s=1

 Return

Step 4: In the Consumer function

 While s==0 do nothing

 Display the consumed value

 Assign s=0

 Return

Step 5: Create threads for producer and consumer function to make it run concurrently

Step 6: Stop

PROGRAM:

```
#include<stdio.h>
#include<stdlib.h>
#include<unistd.h>
#include<time.h>
#include<sys/types.h>
#include<sys/IPC.h>
#include<sys/sem.h>
#define num_loops 5
union semun
{
    int val;
    struct semid_ds *buf;
    short *array;
};
int main(int argc,char *argv[]){
    int semset_id;
    union semun sem_val;
    int child_pid;
    int i;
    struct sembuf sem_op;
    int rc;
    struct timespec delay;
```

```

semset_id=semget(IPC_PRIVATE,1,0600);
if(semset_id== -1)
{
    perror("semget");
    exit(1);
}
printf("SEMAPHORE SET CREATED SEMAPHORE SET ID%d\n",semset_id);
sem_val.val=0;
rc=semctl(semset_id,0,SETVAL,sem_val);
child_pid=fork();
switch(child_pid)
{
    case 1:perror("fork");exit(1);
    case 0:for(i=0;i<num_loops;i++)
    {
        sem_op.sem_num=0;
        sem_op.sem_op=-1;
        sem_op.sem_flg=0;
        semop(semset_id,&sem_op,1);
        printf("Consumer consumed item %d\n",i);
        fflush(stdout);
    }
    break;
default:for(i=0;i<num_loops;i++)
{
    printf("Producer produced item %d\n",i);
    fflush(stdout);
    sem_op.sem_num=0;
    sem_op.sem_op=1;
    sem_op.sem_flg=0;
    semop(semset_id,&sem_op,1);
    if(rand()>3*(RAND_MAX/4))
    {
        delay.tv_sec=0;
        delay.tv_sec=10;
        nanosleep(&delay,NULL);
    }break;
}
}
return 0;
}

```

OUTPUT:

INFERENCE:

RESULT:

Thus, the program for simulation of producer-consumer problem using semaphore has been executed and output is verified successfully.

Ex. No: 7	SHARED MEMORY & INTERPROCESS COMMUNICATION
------------------	---

AIM:

To develop a client-server application program, this uses shared memory using IPC

ALGORITHM:

Server:

1. Define shared memory size of 30 bytes
2. Define the key to be 5600
3. Create a shared memory using shmget () system calls and gets the shared memory id in variable shmid.
4. Attach the shared memory to server data space
5. Get the content to be placed in the shared memory from the user of the server.
6. Write the content in the shared memory, which will read out by the client.
7. Stop

PROGRAM:

```
#include<stdio.h>
#include<sys/types.h>
#include<sys/msg.h>
#include<sys/ipc.h>
#include<string.h>
#define msgsz 3
typedef struct msgbuffer
{
    long mtype;
    char mtext[msgsz];
}mbuffer;
main( )
{
    int msgflg=IPC_CREAT|0666;
    key_t key;
    int msqid,buffer;
    mbuffer mb;
    key=1234;
    if((msqid=msgget(key,msgflg))<0)
    {
        perror("msgget");
        return 1;
    }
    else
        mb.mtype=1;
    strcpy(mb.mtext,"HAI");
    buffer=strlen(mb.mtext);
```

```

if(msgsnd(msqid,&mb,buffer,msgflg)<0)
{
    printf("%d %ld %s %d",msqid,mb.mtype,mb.mtext,buffer);
    perror("msgsnd");
    return 1;
}
else
    printf(" MESSAGE : %s IS SENT ",mb.mtext);
return 0;
}

```

OUTPUT:

CLIENT

Step1: Initialize size of shared memory shmsize to 27.

Step2: Initialize key to 2013 (same value as in server)

Step3: Obtain access to the same shared memory segment using same key.

If obtained then display the shmid else print "Server not started"

Step4: Attach client process to the shared memory using shmat with shmid as parameter.

If pointer to the shared memory is not obtained, then stop.

Step5: Read contents of shared memory and print it.

Step6: After reading, modify the first character of shared memory to '*'.

Step7: Stop

PROGRAM FOR CLIENT:

```

#include<stdio.h>
#include<sys/types.h>
#include<sys/msg.h>
#include<sys/ipc.h>
#include<stdio.h>
#define msgsz 8
typedef struct msgbuffer
{
    long mtype;
    char mtext[msgsz];
}
mbuffer;
main( )
{
    key_t key;
    int msqid,buffer;
    mbuffer mb;
    key=1234;
    if((msqid=msgget(key,0666))<0)
    {

```

```
perror("msgget");
return 0;

}

if(msgrcv(msqid,&mb,msgsz,1,0)<0)
{

perror("msgrev");
return 1;
}
printf(" MESSAGE : %s IS RECEIVED\n",mb.mtext);
return 0;
}
```

OUTPUT:

INFERENCE:

RESULT:

Thus the program to implement interprocess communication using shared memory is executed and verified successfully.

Ex. No: 8**BANKER'S ALGORITHM DEADLOCK AVOIDANCE****AIM:**

To write a program to implement deadlock avoidance using Banker's Algorithm.

ALGORITHM:**Safety algorithm**

1. Start
2. Initialize a temporary vector W (Work) to equal the available vector A.
3. Find an index i (row i) such that
 Need i \leq W
 If no such row exists, the system will deadlock, since no process can run to completion.
4. If such a row is found, mark this process as finished, and add all its resources to W
 Vector i,
 $W = W + C_i$

Go to step 2, until either all processes are marked terminated (in this case initial state is safe), or until a deadlock occurs, in which the state is not safe.

Resource – request algorithm

1. If Request i \leq Needi , go to step 2. Otherwise, error
2. If Request i \leq Available, go to step 3. Otherwise, Pi must wait, since resources are not available
3. Modify the state (the system pretend to have allocated the requested resources to process
 Pi) Available = Available - Requesti
 Allocationi = Allocationi +
 Requesti Needi = Needi -
 Requesti
4. If the resulting state is safe, the transaction is completed and process Pi is allocated its resources. If new state is unsafe, then Pi must wait for Requesti and the old state is restored.
5. Stop the program.

PROGRAM:

```
#include<stdio.h>
int max[100][100];
int alloc[100][100];
int need[100][100];
int avail[100];
int n,r;
void input( );
```

```

RESULT:

Thus the program to implement deadlock avoidance using Banker's Algorithm is implemented and executed successfully.

Ex. No: 9	DEADLOCK DETECTION
-----------	--------------------

AIM:

To write a program to implement deadlock detection.

ALGORITHM 1: Simply detects the existence of a Cycle:

Step1: Start at any vertex finds all its immediate neighbors.

Step2: From each of these find all immediate neighbors, etc.

Step3: Until a vertex repeats (there is a cycle) or one cannot continue (there is no cycle)

Step4: Stop.

ALGORITHM 2: On a copy of the graph:

Step1: See if any Processes NEEDs can all be satisfied.

Step2: If so satisfy the needs with holds and remove that Process and all the Resources it holds from the graph.

Step3: If any Process are left Repeat step a

Step4: If all Processes are finally removed by this procedure there is no Deadlock in the original graph, if not there is.

Step5: Stop.

PROGRAM:

```
#include<stdio.h>
int max[100][100];
int alloc[100][100];
int need[100][100];
int avail[100];

EX.NO:11	MEMORY ALLOCATION METHODS
-----------------	----------------------------------

AIM:

To create a simulator for memory management algorithm.(First Fit, Best Fit, Worst Fit)

ALGORITHM

1) FIRST FIT

Allocates the first hole that is big enough. Searching can be started either at the beginning or where the previous first fit search end read.

- 1.Start the process.
- 2.Declare the size.
- 3.Get the number of processes to be inserted.
- 4.Allocate the first hole that is big enough searching.
- 5.Start at the beginning of the set of holes.
- 6.If not start at the hole that is sharing the previous first fit search end.
- 7.If large enough then stop searching in the procedure.
- 8.Display the values.
- 9.Stop the process.

2) BEST FIT

Best Fit allocates the smallest hole that is big enough. We must search the entire list, unless the list is kept ordered by size.

- 1.Start the program.
2. Declare the size.
3. Get the number of processes to be inserted.
4. Allocate the best hole that is small enough searching.
5. Start at the best of the set of holes.
6. If not start at the hole that is sharing the previous best fit search end.
7. Compare the hole in the list.
8. If small enough then stop searching in the procedure.
9. Display the values.
10. Stop the program.

3) WORST FIT

Allocates to the largest hole.

1. Start the program.
2. Declare the size.
3. Get the number of processes to be inserted.

4. Allocate the first hole that is small enough searching.

5. If small enough then stop searching in the procedure.

6. Display the values.

7. Stop the program.

PROGRAM:

```
#include<stdio.h>
main( )
{
    int p[10],np,b[10],nb,ch,c[10],d[10],alloc[10],flag[10],i,j;

RESULT:

Thus the implementation of memory allocation methods for fixed partition is executed successfully.

AIM:

To implement memory allocation with pages

ALGORITHM:

Step1: Read all the necessary input from the keyboard.

Step2: Pages - Logical memory is broken into fixed - sized blocks.

Step3: Frames – Physical memory is broken into fixed – sized blocks.

Step4: Calculate the physical address using the following

Physical address = (Frame number * Frame size) + offset

Step5: Display the physical address.

Step6: Stop the process.

PROGRAM:

```
#include<stdio.h>
int main( )
{
    int ms, ps, nop, np, rempages, i, j, x, y, pa, offset;
    int s[10], fno[10][20];
    printf("\nEnter the memory size --");
    scanf("%d",&ms);
    printf("\nEnter the page size --");
    scanf("%d",&ps);
    nop = ms/ps;
    printf("\nThe no. of pages available in memory are --%d ",nop);
    printf("\nEnter number of processes --");
    scanf("%d",&np);
    rempages = nop;
    for(i=1;i<=np;i++)
    {
        printf("\nEnter no. of pages required for p[%d]--",i);
        scanf("%d",&s[i]);
        if(s[i] >rempages)
        {
            printf("\nMemory is Full");
        }
    }
}
```

```
break;  
}  
rempages = rempages -s[i];  
printf("\nEnter pagetable for p[%d] ---",i);  
for(j=0;j<s[i];j++)  
    scanf("%d",&fno[i][j]);  
printf("\nEnter Logical Address to find Physical Address ");  
printf("\nEnter process no. and pagenumber and offset --");  
scanf("%d %d %d",&x,&y, &offset);  
if(x>np || y>=s[i] || offset>=ps)  
    printf("\nInvalid Process or Page Number or offset");  
else

FILE ORGANIZATION TECHNIQUES

AIM:

To implement File Organization Structures in C are

- a. Single Level Directory
- b. Two-Level Directory
- c. Hierarchical Directory Structure
- d. Directed Acyclic Graph Structure

a. Single Level

ALGORITHM:

Step 1:Start

Step 2: Initialize values gd=DETECT,gm,count,i,j,mid,cir_x; Initialize character array fname[10][20];

Step 3: Initialize graph function as Initgraph(& gd, &gm, " c:/tc/bgi"); Clear device();

Step 4:set back ground color with setbkcolor();

Step 5:read number of files in variable count.

Step 6:if check i<count

Step 7: for i=0 & i<count i increment;

Cleardevice(); setbkcolor(GREEN); read file name;

setfillstyle(1,MAGENTA);

Step 8: mid=640/count;

cir_x=mid/3; bar3d(270,100,370,150,0,0); settextstyle(2,0,4); settextstyle(1,1);

outtextxy(320,125,"rootdirectory"); setcolor(BLUE);

i++;

Step 9:for j=0&&j<=i&&cir_x+=mid j increment; line(320,150,cir_x,250);

fillellipse(cir_x,250,30,30); outtextxy(cir_x,250,fname[i]);

Step 10: End

PROGRAM:

```
#include<stdio.h>
#include<stdlib.h>
#include<string.h>
struct
{
char dname[10],fname[10][10];
int fcnt;
}dir;
void main( )
```

```
{  
int i,ch;  
char f[30];  
dir.fcnt = 0;  
printf("\nEnter name of directory -- ");  
scanf("%s", dir.dname);  
while(1)  
{

Ex. No: 15	FILE ALLOCATION STRATEGIES

FILE ALLOCATION STRATEGIES

AIM:

To implement File allocation in C are

- a. Sequential File Allocation
- b. Indexed File Allocation
- c. Linked File Allocation

a. Sequential File Allocation:

ALGORITHM:

Step 1: Start the program.

Step 2: Get the number of files.

Step 3: Get the memory requirement of each file.

Step 4: Allocate the required locations to each in sequential order

a) Randomly select a location from available location

s1= random(100);

b) Check whether the required locations are free from the selected location. if(b[s1].flag==0)

{

for(j=s1;j<s1+p[i];j++) {

if((b[j].flag)==0) count++;

} if(count==p[i]) break;

}

c) Allocate and set flag=1 to the allocated locations. for(s=s1;s<(s1+p[i]);s++)

{

k[i][j]=s; j=j+1; b[s].bno=s; b[s].flag=1;

}

Step 5: Print the results fileno, length ,Blocks allocated. Step 6: Stop the program

PROGRAM:

```
#include<stdio.h>
#include<conio.h>
#include<string.h>
void main( )
{
    int st[20],b[20],b1[20],ch,i,j,n,blocks[20][20],sz[20];
    char F[20][20],S[20];

        break;
}while(1);
}

```

OUTPUT:

b. Indexed File Allocation:

ALGORITHM:

Step 1: Start the program.

Step 2: Get the number of files.

Step 3: Get the memory requirement of each file.

Step 4: Allocate the required locations by selecting a location randomly q= random(100);

a) Check whether the selected location is free .

b) If the location is free allocate and set flag=1 to the allocated locations. q=random(100);

{

if(b[q].flag==0) b[q].flag=1; b[q].fno=j; r[i][j]=q;

Step 5: Print the results fileno, length ,Blocks allocated.

Step 6: Stop the program

PROGRAM:

```
#include<stdio.h>
#include<conio.h>
#include<string.h>
int n;
void main( )
{
    int b[20],b1[20],i,j,blocks[20][20],sz[20];
    char F[20][20],S[20],ch;
    clrscr( );
    printf("\n Enter no. of Files ::");
    scanf("%d",&n);
    for(i=0;i<n;i++)
    {
        printf("\n Enter file %d name ::",i+1);
        scanf("%s",&F[i]);
        printf("\n Enter file%d size(in kb):::",i+1);
        scanf("%d",&sz[i]);
        printf("\n Enter blocksize of File%d(in bytes):::",i+1);
        scanf("%d",&b[i]);
    }
    for(i=0;i<n;i++)
    {
        b1[i]=(sz[i]*1024)/b[i];
        printf("\n\nEnter blocks for file%d",i+1);
        for(j=0;j<b1[i];j++)
    }
```

```
{  
    printf("\n Enter the %d block ::",j+1);  
    scanf("%d",&blocks[i][j]);  
}  
}  
do  
{  
    printf("\nEnter the Filename ::");  
    scanf("%s",&S);  
    for(i=0;i<n;i++)  
    {  
        if(strcmp(F[i],S)==0)  
        {  
            printf("\nFname\tFsize\tBsize\tNblocks\tBlocks\n");  
            printf("\n-----\n");  
            printf("\n%s\t%d\t%d\t%d\t",F[i],sz[i],b[i],b1[i]);  
            for(j=0;j<b1[i];j++)  
                printf("%d->",blocks[i][j]);  
        }  
    }  
    printf("\n-----\n");  
    printf("\nDo U want to continue ::(Y:n)");  
    scanf("%d",&ch);  
}while(ch!=0);  
}
```

OUTPUT:

c. Linked File Allocation

ALGORITHM:

Step 1: Start the program.

Step 2: Get the number of files.

Step 3: Get the memory requirement of each file.

Step 4: Allocate the required locations by selecting a location randomly $q = \text{random}(100)$;

a) Check whether the selected location is free .

b) If the location is free allocate and set flag=1 to the allocated locations. While allocating next location address to attach it to previous location

```
for(i=0;i<n;i++) {  
    for(j=0;j<s[i];j++) {  
        q=random(100); if(b[q].flag==0) b[q].flag=1; b[q].fno=j; r[i][j]=q;  
        if(j>0) {  
            p=r[i][j-1]; b[p].next=q; }  
    } }
```

Step 5: Print the results fileno, length ,Blocks allocated.

Step 6: Stop the program

PROGRAM:

```
#include<stdio.h>  
void main()  
{  
    char a[10];  
    int i,sb,eb,fb1[10];  
    printf("\n enter the file name:");  
    scanf("%s",a);  
    printf("\n Enter the starting block:");  
    scanf("%d",&sb);  
    printf("Enter the ending Block:");  
    scanf("%d",&eb);  
    for(i=0;i<5;i++)  
    {  
        printf("Enter the free block %d",i+1);  
        scanf("%d",&fb1[i]); }  
    printf("\n File name \t Starting block \t Ending block \n");  
    printf("%s \t\t %d\t\t %d",a,sb,eb);  
    printf("\n %s File Utilization of Linked type of following blocks:",a);  
    printf("\n %d->",sb);  
    for(i=0;i<5;i++)  
    {
```

```
printf("%d->",fb1[i]);
}
printf("%d\n",eb);
}
```

PRATHYUSHA ENGINEERING COLLEGE

INFERENCE:

RESULT:

Thus the program to implement File allocation in C is executed successfully.

CONTENT BEYOND THE SYLLABUS

Ex. No: 16	VIRTUALIZATION
-------------------	-----------------------

AIM:

To implement Virtualization concept using Virtual box.

PROCEDURE:

```
cse@ubuntu-WIV37205-0125:~$ sudo apt-get install virtual box
```

[sudo] password for oslab:

Reading package lists... Done

Building dependency tree

Reading state information... Done

virtualbox is already the newest version.

0 upgraded, 0 newly installed, 0 to remove and 61 not upgraded.

ALGORITHM :

Step 1: open virtualbox and click next.

Step 2: enter the name and click next

Step 3: in the memory dialog box, click next.

Step 4: select vmdk and click next.

Step 5: select start-up disk->create new hard disk and click next.

Step 6: select dynamically allocated storage and click next.

Step 7: in virtual disk file browse the location by selecting 26gb volume and click save.

Step 8: the path of the location is shown and click next.

Step 9: a summary dialog box opens and click create.

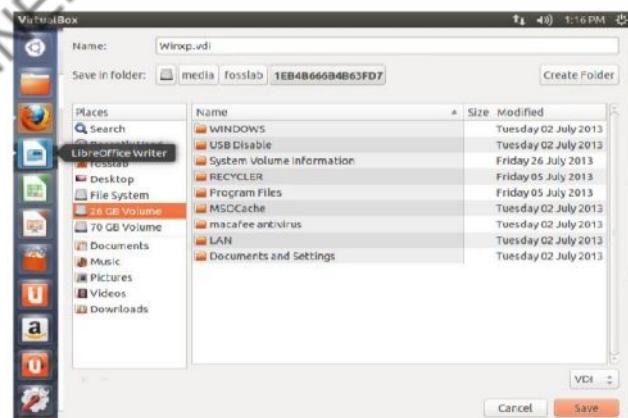

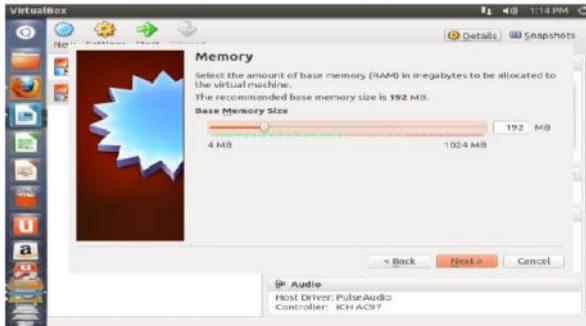

Step 10: click next to run the virtual machine.

Step 11: installation of windows starts.

Step 12: set the name and organization.

Step 13: set the administration password.

Step 14: Virtual OS starts.

INFERENCE:

RESULT:

Thus the program to implement Virtualization concept using Virtual box is done and executed successfully.

AIM :

To download / access The latest kernel source code from kernel.org,compile the kernel and install it in the local system and to Try viewing the source code of the kernel.

PROCEDURE**TO KNOW THE CURRENT VERSION OF THE KERNEL:**

```
cse@ubuntu -desktop:~$ uname -r  
3.5.0-17-generic
```

DOWNLOAD THE LATEST LINUX KERNEL CODE AND EXTRACT IT IN THE SAME LOCATION:

http://www.berkes.ca/guides/linux_kernel.html

CHANGE THE DIRECTORY TO THE OSLAB:**TO LIST ALL THE FOLDERS AVAILABLE:**

```
cse@ubuntu-desktop:~$ ls  
3yr it.doc      k2.pl    k5.html~          ppp      select.php~  
3yr result.odt   k2.pl~   k.pl             pro.php   Templates  
build_systems    k2.py    k.pl~            pro.php~  tmp  
compfrmsrc      k2.py~   linux-3.2.17.tar.bz2  Public    Videos  
Desktop         k3.html  linux-3.6.2.tar.bz2 sam1.php        VirtualBox VMs  
Documents        k3.html~ Music           sam1.php~  
Downloads        k4.php   Pictures          sam.php
```

CHANGE THE DIRECTORY TO THE EXTRACTED LINUX

```
FILE cse@ubuntu-desktop:~$ cd Downloads cse@ubuntu-  
desktop:~/Downloads$ cd linux-3.11-rc6
```

TO INSTALL LIBNCURSES5:

```
cse@ubuntu -desktop:~/Downloads$ cd linux-3.11-rc6 sudo apt-get install  
libncurses5-dev
```

TO COMPILE KERNEL REMOTELY:

```
cse@ubuntu -desktop:~/Downloads/linux-3.11-rc6$ makes menuconfig
```

TO UNCOMPRESS KERNEL TO HIGH MEMORY: cse@ubuntu - desktop:~/Downloads/linux-3.11-rc6\$ makes bzImage make [1]:
